

Abstract

A method is provided for consuming information based on a geographic location profile of a user. The method receives a first set of information, based on a geographic location of interest to a user. The method sends, through a network, the first set of  
5 information to assemble a geographic location profile of the user. The method receives, through the network, a second set of information, based on the geographic location profile of the user. The method then communicates the second set of information to the user. The geographic location profile of the user is based on the first set of information.
